

IN THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claims in the application:

1. (Currently Amended) A method for accessing a wireless local area network in a telecommunications system, the system including at least one terminal and a plurality of networks, the method comprising:

storing information sets describing settings used to access wireless local area networks and their associated resources;

scanning for information related to names of available wireless local area networks using the terminal;

determining available information sets by comparing the information related to names of available wireless local area networks to the stored information sets; and

accessing at least one wireless local area network based on settings described in ~~the~~ an available information ~~sets~~set.

wherein the storing stores network names of wireless local area networks associated with the stored information sets, the scanning sends network identity requests and searches for network identity responses, and the determining available information sets determines the available information sets by comparing the stored network names to the scanned information related to names of available wireless local area networks.

2. (Previously Presented) The method of claim 1, further comprising:
informing a user of the terminal about the available information sets;
receiving a user's selection of one of the available information sets; and
accessing at least one wireless local area network based on the settings described in the available information set selected by the user.

3. (Previously Presented) The method of claim 1, wherein the stored information sets are stored separately for each wireless local area network on a smart card.

4. (Cancelled)

5. (Currently Amended) The method of claim [[4]]1, further comprising:
storing network identifiers representing a group of network names using wildcard characters in the stored information sets; and
determining the available information sets by comparing the stored network identifiers to the scanned information related to names of available wireless local area networks.

6. (Cancelled)

7. (Previously Presented) The method of claim 1, wherein the stored information sets comprise channel settings indicating whether at least one of (i) a used radio channel is automatically or manually selected and (ii) whether the stored information sets comprise operation mode settings indicating whether a used operation mode is an ad-hoc mode or an infrastructure mode.

8. (Currently Amended) A terminal comprising:
a transceiver configured to communicate with a wireless local area network;
memory means for storing information sets describing settings used to access wireless local area networks and their resources;

scanning means for scanning for information related to identifying names of available wireless local area networks;

determination means for determining available information sets by comparing the information related to names of available wireless local area networks to information sets stored by the memory means; and

access means for accessing at least one wireless local area network based on the settings described in one or more of the an available information sets.

wherein the memory means are configured to store names of the wireless local area networks belonging to the stored information sets, the scanning means are arranged to perform the scanning by sending network identity requests and searching for network identity responses, and the determination means are configured to determine the available information sets by comparing the stored network names to the scanned information identifying the names of the available wireless local area networks.

9. (Previously Presented) The terminal of claim 8, further comprising:
user interface means for informing a user of the terminal about the available
information sets and letting the user select one of the available information sets; and
wherein the access means are configured to access at least one wireless local area
network based on the settings described in the one information set the user has accepted.

10. (Previously Presented) The terminal of claim 8, wherein the stored
information sets are stored as network-specific profiles on a smart card that may be accessed
by the terminal.

11.-12 (Cancelled)

13. (Previously Presented) The terminal of claim 8, wherein the stored
information sets comprise channel settings indicating at least one of (i) whether a used radio
channel is automatically or manually selected and (ii) whether the stored information sets
comprise operation mode settings indicating whether a used operation mode is an ad-hoc
mode or an infrastructure mode, and

wherein the terminal is configured to select at least one of (i) the used radio channel
based on channel settings of the available information sets and (ii) an ad-hoc mode or an
infrastructure mode based on the operation mode settings of the available information sets.

14. (Currently Amended) A terminal comprising:
a transceiver configured to communicate with a wireless local area network;
at least one memory device configured to store information sets describing settings
used to access wireless local area networks and their resources;
at least one scanner configured to scan information related to identifying names of
available wireless local area networks;
at least one determination module configured to determine available information sets
by comparing the information related to names of available wireless local area networks to
information sets stored by the memory means; and
at least one access device configured to access at least one wireless local area network
based on settings described in one or more of the available information sets,

wherein the at least one memory device is arranged to store names of the wireless local area networks belonging to the stored information sets, the at least one scanner is configured to perform the scanning by sending network identity requests and searching for network identity responses, and the at least one determination module is configured to determine the available information sets by comparing the stored network names to the scanned information identifying the names of the available wireless local area networks.

15. (Previously Presented) The terminal of claim 14, further comprising:
at least one user interface configured to inform a user of the terminal about the available information sets and letting the user select one of the available information sets,
wherein the at least one access device is arranged to access at least one wireless local area network based on the settings described in the one information set the user has accepted.

16. (Previously Presented) The terminal of claim 14, wherein the stored information sets are stored as network-specific profiles on a smart card that may be accessed by the terminal.

17.-18. (Cancelled)

19. (Previously Presented) The terminal of claim 14, wherein the stored information sets comprise channel settings indicating at least one of (i) whether a used radio channel is automatically or manually selected and (ii) whether the stored information sets comprise operation mode settings indicating whether a used operation mode is an ad-hoc mode or an infrastructure mode, and

wherein the terminal is configured to select at least one of (i) the used radio channel based on channel settings of the available information sets and (ii) an ad-hoc mode or an infrastructure mode based on the operation mode settings of the available information sets.

20. (Previously Presented) A method according to claim 1, wherein the information set comprises at least one of the following: DHCP (Dynamic Host Control Protocol) settings, TCP/IP (Transport Control Protocol/Internet Protocol) settings, Proxy settings, or domain logon and work-group settings.

21. (Currently Amended) ~~A method according to~~ The terminal of claim 8, wherein the information set comprises at least one of the following: DHCP (Dynamic Host Control Protocol) settings, TCP/IP (Transport Control Protocol/Internet Protocol) settings, Proxy settings, or domain logon and work-group settings.

22. (Currently Amended) ~~A method according to~~ The terminal of claim 14, wherein the information set comprises at least one of the following: DHCP (Dynamic Host Control Protocol) settings, TCP/IP (Transport Control Protocol/Internet Protocol) settings, Proxy settings, or domain logon and work-group settings.
